Summer CS290
Matthew Wong
A6: Practice!
07/24/20

Over the course of this week's lectures, we had to implement sessions, and HTTP requests. Overall if there was not examples provided I would have had a difficult time understanding all the material. However with the examples that could be cloned from the github repository I was able to review the material and understand.

If you looked at all the materials covered over the course of the week, the most difficult out of all of them was probably implementing sessions into a hosted site. To understand the material more I reviewed the provided samples as well as several github repositories I found online covering sessions.

I also looked at documentation from nodeJS that covered the topics of implementing sessions into my projects.

After reviewing all the extra materials and the documentation, I watched several youtube videos that helped me grasp how to utilize it more effectively.
